MORBIDITY DATA FOR INDIVIDUAL STATIONS WITH COLORED STRENGTH OF 1000 OR MORE . . .	29

# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, WD AGO 8-122, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The proportion of the average daily strength of the command which is confined to hospital or quarters (including patients evacuated from overseas) is given in the "Year-to-date" section of the summary table. The mean number of noneffectives per thousand strength shown in the weekly section of the summary table includes only patients admitted to hospital or quarters from activities in the Continental United States; these figures, therefore, are noneffective rates for troops stationed in the United States.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on WD AGO 8-122 is incomplete; especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 10 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

### EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

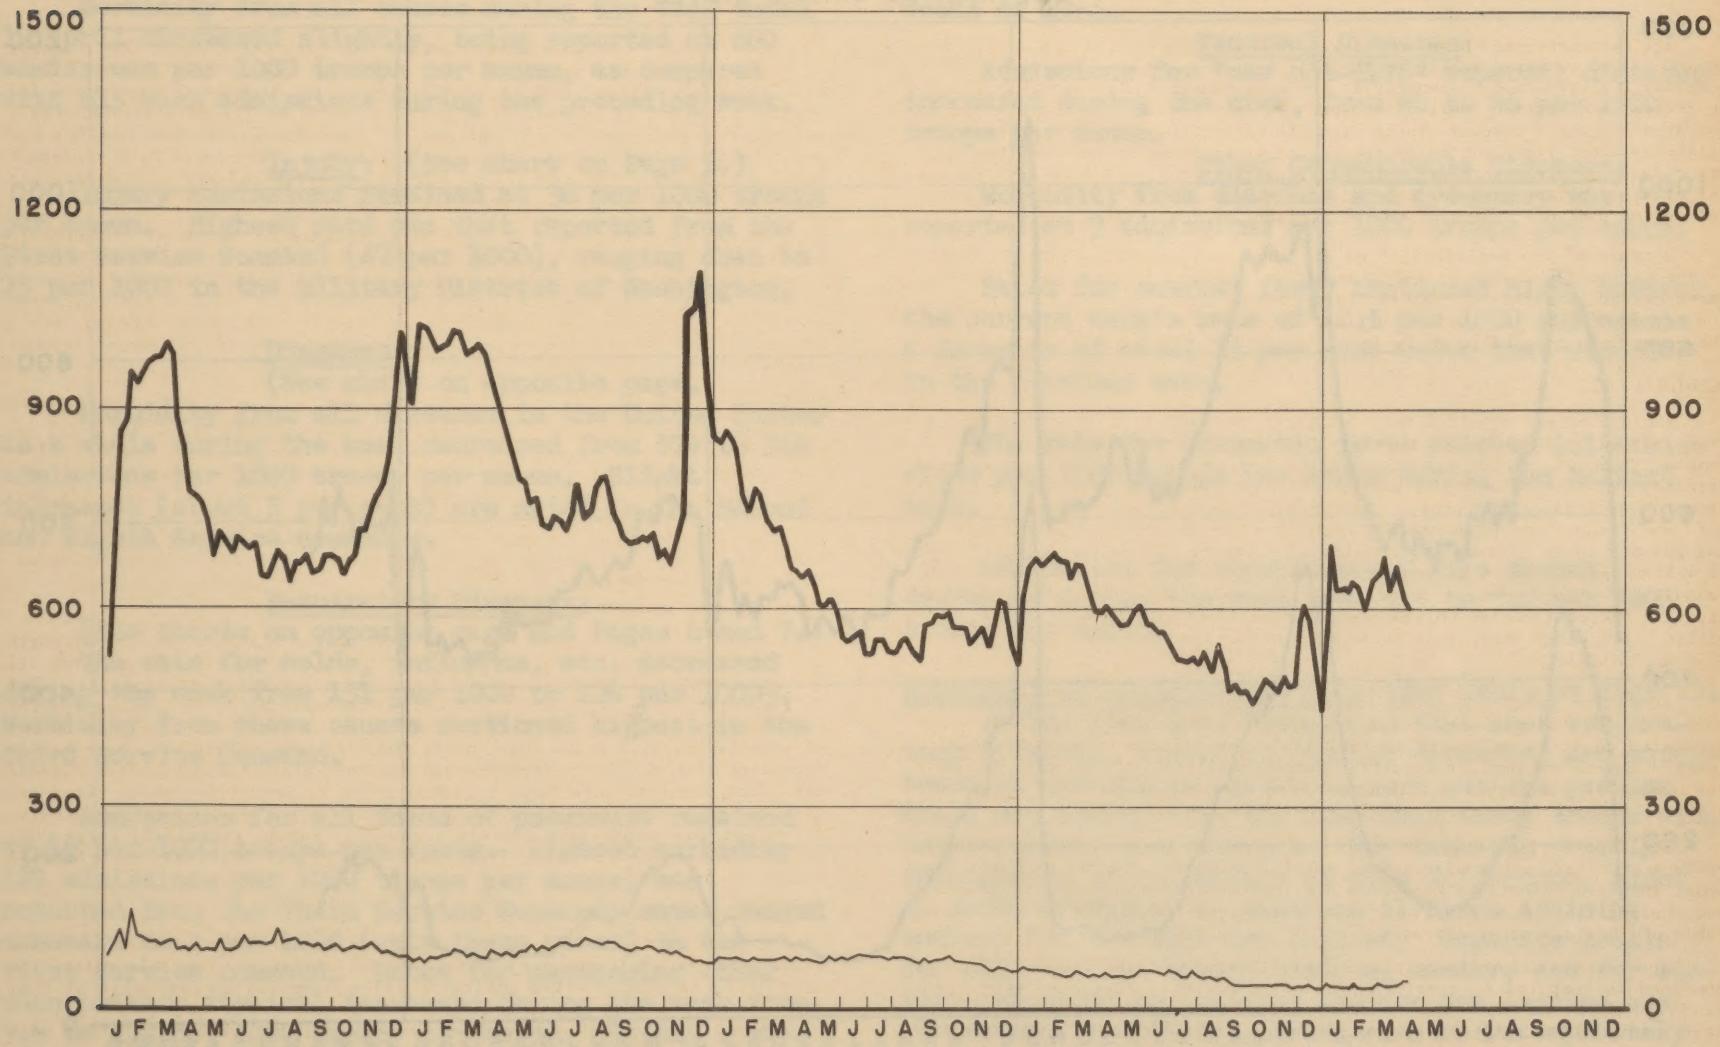

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### MORBIDITY FROM: All Causes: (See chart on Page 3.)

Morbidity from all causes during the week ended 12 April decreased slightly, being reported at 602 admissions per 1000 troops per annum, as compared with 615 such admissions during the preceding week.

### Injury: (See chart on Page 3.)

Injury admissions remained at 36 per 1000 troops per annum. Highest rate was that reported from the First Service Command (47 per 1000), ranging down to 25 per 1000 in the Military District of Washington.

### Diseases:

(See chart on opposite page.)

Morbidity from all diseases in the United States as a whole during the week decreased from 579 to 566 admissions per 1000 troops per annum. Slight increases (about 3 per cent) are noted in the Second and Eighth Service Commands.

### Respiratory Diseases:

(See charts on opposite page and Pages 6 and 7.)

The rate for colds, influenza, etc. decreased during the week from 131 per 1000 to 126 per 1000. Morbidity from these causes continued highest in the Third Service Command.

Admissions for all forms of pneumonia remained at 16 per 1000 troops per annum. Highest morbidity (29 admissions per 1000 troops per annum) was reported from the Third Service Command; rates ranged downward to 4 per 1000 (only three cases) in the First Service Command. Rates for pneumonias other than primary atypical decreased during the week from 5.6 to 4.4 per 1000 troops per annum. In the corresponding period of last year, this rate was 3.7 and

3.6 per 1000, while it moved from 5.8 to 6.1 in these weeks of 1944.

### Venereal Diseases:

Admissions for "new not-EPTS" venereal diseases increased during the week, from 80 to 86 per 1000 troops per annum.

### Other Communicable Diseases:

Morbidity from diarrhea and dysentery was reported at 3 admissions per 1000 troops per annum.

Rates for scarlet fever continued high; however, the current week's rate of 12.5 per 1000 represents a decrease of about 10 per cent under that reported in the previous week.

The rate for rheumatic fever reached 4.1 admissions per 1000 troops per annum during the current week.

Admissions for streptococcal sore throat decreased during the week from 3.9 to 3.2 per 1000 troops per annum.

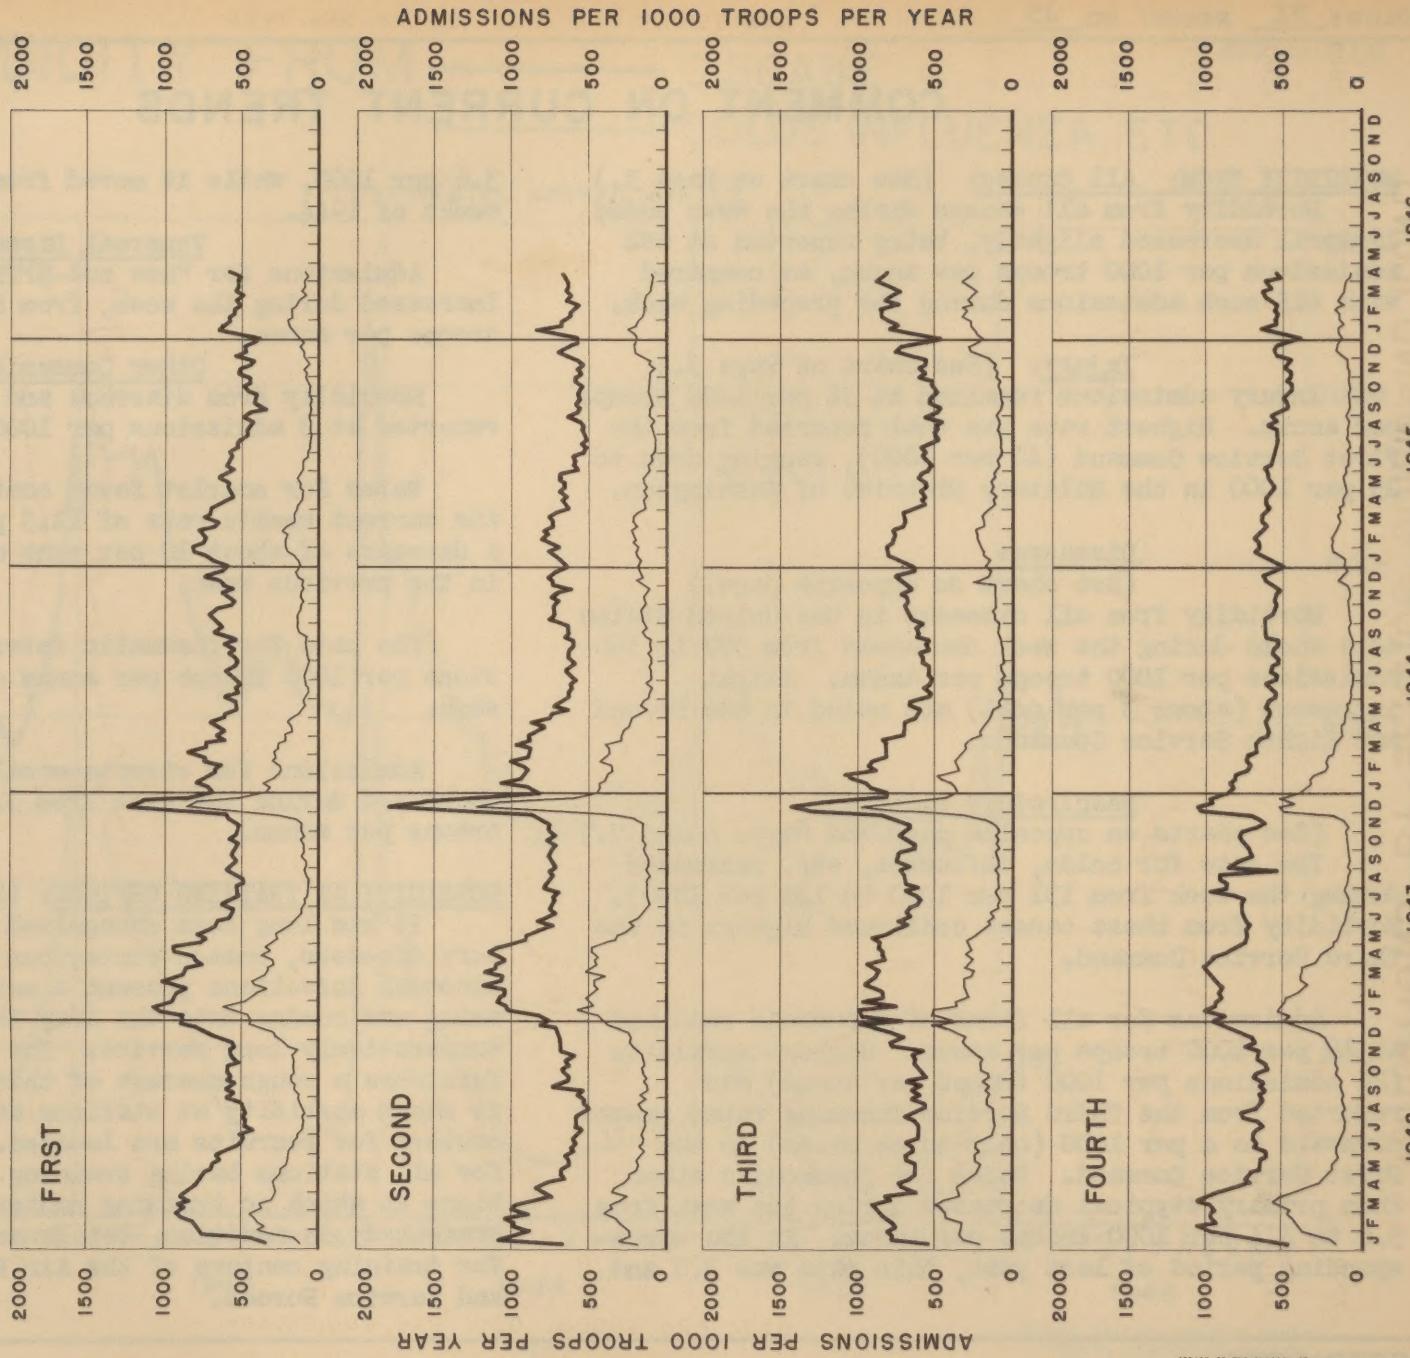

### MORBIDITY AT TRAINING CENTERS: (See table on Page 13.)

It has long been recognized that most respiratory diseases, common contagious diseases, and streptococcal infections present a more serious problem among men coming into the Army than among troops with comparatively long service. The table on page 13 furnishes a rough measure of this difference, since it shows morbidity at stations at which training centers for recruits are located. Separate totals for all stations having training centers and for stations at which no training centers are located are presented; in addition, totals are shown separately for training centers of the Air Forces, Ground Forces, and Service Forces.

## COMMENT ON CURRENT TRENDS (CONT.)

It should be noted that a distinction cannot be made, on the basis of the Statistical Health Report, between those troops at a given station who are undergoing basic training and those who are engaged in other activities. Data must be shown for all troops at stations at which training centers are located; these data, therefore, cannot be said to measure morbidity among trainees alone.

The admission rate for diseases at stations having training centers exceeded that at other stations by about a third; this rate, however, decreased during the week by about 6 per cent at stations having training centers, and remained relatively unchanged at other stations.

Morbidity from colds, influenza, etc., at stations having training centers, while still three times that at other stations, moved downward during the week from 254 to 231 admissions per 1000 troops per annum. Rates at ASFTC's continued higher than those at Air Force and Ground Force centers.

Admissions for pneumonia at training center stations as a whole remained at 32 per 1000 troops per annum, contrasting with the rate of 10 at other stations; AAFBTC's continued to show highest morbidity. However, the rate at Ground Forces centers increased from 27 to 37 admissions per 1000 troops.

Morbidity from scarlet fever at stations having training centers dropped off during the week from 37 to 32 admissions per 1000 troops per annum. The rate for rheumatic fever moved downward, although 12 cases reported at Sheppard Field resulted in doubling last week's rate for AAFBTC's.

The venereal disease admission rate at training center stations as a whole continued lower than that for other stations, but the current week's increase over the preceding week was larger for training centers. (High venereal disease rates at ASFTC's are accounted for in large measure by the larger ratio of colored to white troops at these stations than at others.)

NONEFFECTIVE RATE: (See chart on Page 9.)

The noneffective rate for personnel stationed in the continental United States is estimated at 41.7 per 1000 troops for the week ended 12 April as compared with 33.9 per 1000 for the corresponding week of 1945.

PATIENTS REMAINING UNDER TREATMENT: 12 APRIL 1946:

(See chart on Page 9.)

The number of patients remaining in hospital in the Zone of Interior, including patients transferred from overseas, decreased during the week to 96,142 as compared with 99,809 at the end of the previous week.

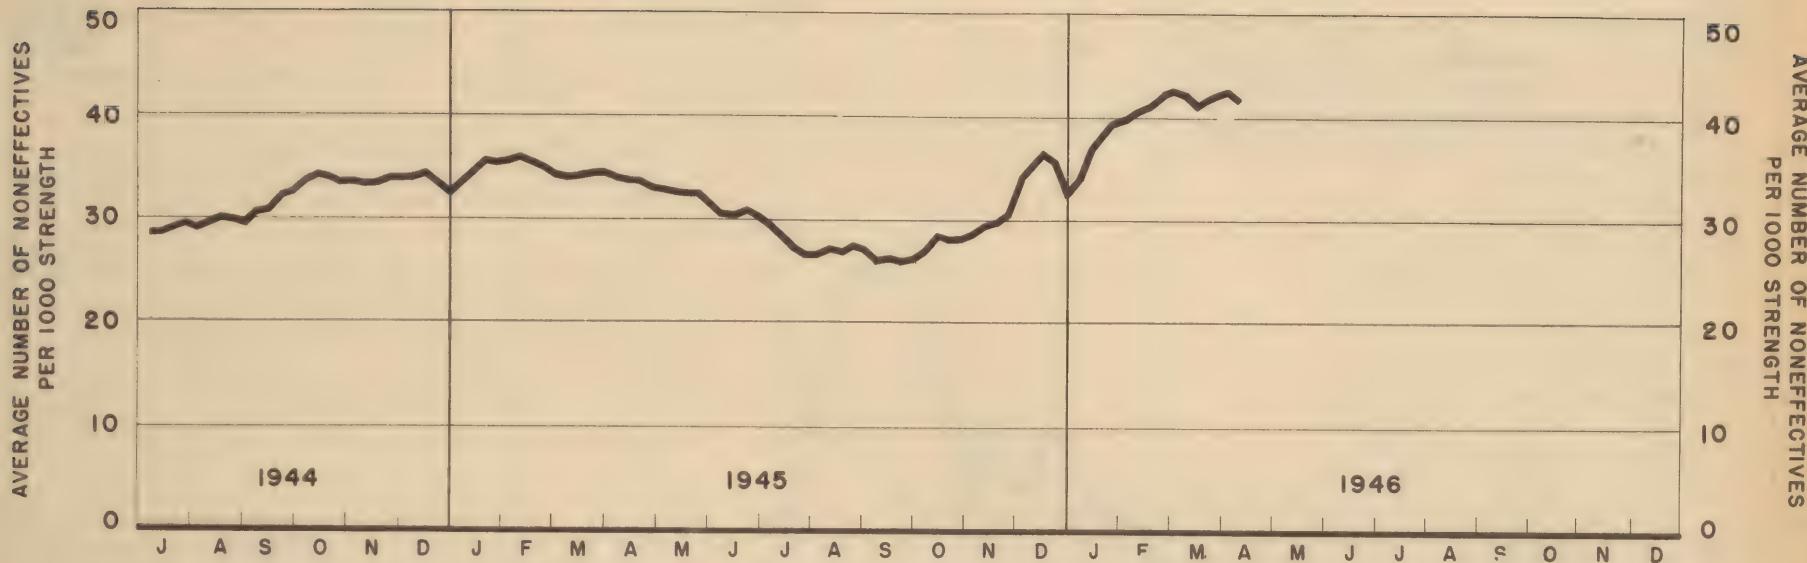

The number of neuropsychiatric cases remaining was 6614 or about 200 less than at the end of the previous week. Nonbattle injury patients remaining numbered about 17,900. Battle wounded remaining decreased by about 700 to 22,176.

CERTIFICATES OF DISABILITY FOR DISCHARGE: (See p. 10.)

In the week ended 12 April there were 1922 enlisted personnel discharged by CDD (about 700 less than the previous week). These discharges included 61 accomplished at Air Force medical activities. Among them were 363 neuropsychiatric cases, about 100 fewer than were separated by this method last week.

## ANALYSIS OF VENEREAL DISEASE DATA

This report, covering the four-week period ended 22 February 1946, presents an analysis of incidence of the venereal diseases among colored males and all other personnel for all units in the continental United States which submit Statistical Health Reports (WD AGO Form 8-122). Data are shown for individual stations where the colored male strength was 1000 or more; for other units in each service command the data are shown in total only.

The term "admissions" as applied to venereal diseases in this report includes not only cases "excused from duty" for at least one day (that is, remaining in a medical activity at midnight on the day of admission), but also cases treated on a duty status ("carded for record only"). Other cases are, in general, reported as "admissions" on WD AGO Form 8-122 only when excused from duty. During January, about 5600 cases of venereal disease, or 50 per cent of the reported venereal disease admissions, were carded for record only, in February, about 5300 cases, 59 per cent of the reported admissions were treated on a duty status. (Since very few, if any, cases of syphilis are treated on a duty status, carded-for-record-only cases are, by and large, personnel suffering from gonorrhea and other venereal diseases. Carded-for-record-only cases in January represented over 60 per cent of the reported admissions for these causes, and almost 75 per cent of them in February.)

The average daily number of personnel not performing duty because of a venereal disease in February was 1.01 per 1000 troops; among white troops, this rate was 0.49 per 1000; among colored troops, 6.77 per 1000. (See chart on this page.)

ADMISSIONS PER 1000 TROOPS PER YEAR

## ANALYSIS OF VENEREAL DISEASE DATA

VENEREAL DISEASES AMONG INDUCTEES  
"EPTS" CASES PER 1000 INDUCTEES

The average weekly number of admissions for EPTS venereal diseases during February was 155, as compared with 124 cases per week in January. The chart on this page shows the ratio of Army inductees having venereal diseases to the total number of Army inductees in each month since June of 1944.

Generally speaking, reported morbidity from "new not-EPTS" venereal diseases in February dropped away from the holiday-distorted high rates noted in January. However, the rate for syphilis among personnel other than colored males, and that for venereal diseases other than syphilis and gonorrhea among colored males remained unchanged. Increases in rates for syphilis among colored males are noted in the Second Service Command and the Military District of Washington; while the rate for other personnel moved upward in the Sixth Service Command. Reported morbidity from syphilis, both for colored males and other personnel, continued highest in the Second Service Command. Rates for gonorrhea among personnel other than colored males increased slightly in the Fourth and more sharply in the Ninth Service Command.
